

1. Faced difficulty in these sections:

- a. The **PRODUCTS SECTION**: It had the most challenging CSS in my pov. To `align-items: flex-start` was not working for the `div-cards` under `products-category`. I was stuck there. Especially to name many different CSS classes and manage them.
- b. **MAJOR LEARNING** The **RESPONSIVE-WIDTH** of the webpage: My webpage failed to acquire the entire width of dimensions on the web page emulator. I am still figuring it out.
- c. The **NAVIGATION BAR DROPDOWN** (  ): I Figured out to toggle the three-bar symbol to open the menu and vice-versa. But I am facing difficulty positioning it in the right place.
- d. **GENERALLY**, I faced hardship in positioning the elements using flex and grid for display.
- e. **MARQUEE** was challenging, but I figured it out from a resource. I had to add a few lines of code this <https://ryanmulligan.dev/blog/css-marquee/>.
- f. **THE ARC**: I figured we have to use two divs with different colors, stack on each other with one having border-radius on the bottom-side.
